

## **Sloping, Benching, Embankments and Bundwalls**

**Course Venue:** Malaysia - Kuala Lumpur

**Course Date:** From 8 Aug 2021 To 12 Aug 2021

**Course Place:** Jalan Conlay Kuala Lumpur

**Course Fees:** 4950 GBP

## Course Description

This course provides guidance for analyzing the static stability of slopes of earth and rock-fill dams, slopes of other types of embankments, excavated slopes, and natural slopes in soil and soft rock. Methods for analysis of slope stability are described and are illustrated by examples and case studies. Criteria are presented for strength tests, analysis conditions, and factors of safety. The methods of stability analysis discussed in this course satisfy all conditions of equilibrium

After participating in this course, you will be able to:

- Identify key issues associated with a specific slope stability problem
- Obtain parameters required for slope stability analysis of the site
- Select the method that is appropriate for the specific slope stability analysis
- Conduct preliminary slope stability analysis by design charts and/or simple calculations
- Assess results of slope stability analysis from computer software
- Recommend viable options for slope stabilization for the specific site

## Course Objective

- To introduce the basic concept of limit equilibrium in static and quasi-static slope stability analyses
- To explain common methods of slope stability analysis, computer software and design charts
- To discuss design considerations for embankments, excavations and other man-made slopes
- To analyze stability of natural slopes in soils and soft rocks
- To outline technologies for slope stabilization
- To practise slope stability analysis and design calculations via exercises and case studies

## Course Outline

### Introduction

- Purpose and scope
- Basic design considerations
- Theory of stability analysis
- Design procedure
- Modes of slope failure

### Design Considerations

- Introduction
- Loading conditions
- During construction and at the end of construction
- Steady-state seepage conditions
- Sudden drawdown stability
- Stability during earthquakes

### Design Criteria

- General
- New embankment dams
- Existing embankment dams
- Other slopes

## **Calculations and Presentations**

- Analysis methods
- Verification of computer analyses and results
- Presentation of the analysis and results
